⚠ Je ne suis pas un designer

“

When designing computer systems, one is often faced with a choice between using a more or less powerful language for publishing information, for expressing constraints, or for solving some problem. This finding explores tradeoffs relating the choice of language to reusability of information. The "Rule of Least Power" suggests choosing the least powerful language suitable for a given purpose.

1. Texte
2. HTML (sémantique)
3. CSS (layout, style, animations simples)
4. SVG (formes et animations complexes)
5. JavaScript, WebAssembly (gestion d'états, appel backend, calculs)

⚠... mais il y a toujours de bonnes raisons pour ne pas suivre ces règles

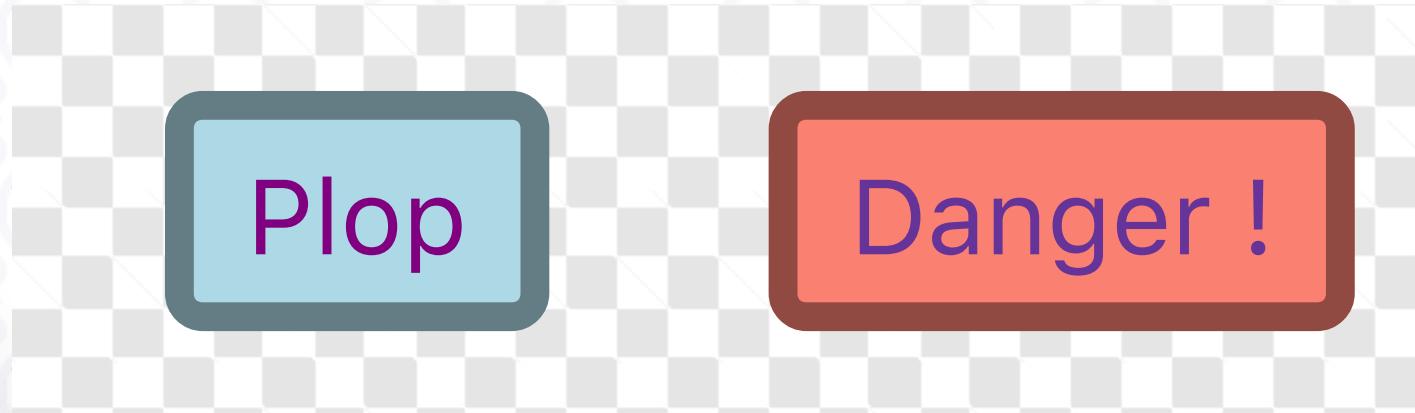

- I. Utiliser un pré-processeur ?
- II. Unités
- III. Flexbox et Grid
- IV. Pseudo éléments
- V. Animations
- VI. Pseudo classes d'état
- VII. Conclusion

# UTILISER UN PRÉ-PROCESSEUR ?

# Bordure des boutons

#6

```
button {  
    background: lightblue;  
    color: purple;  
    /*border: medium solid currentColor;*/  
    border: medium solid rgba(0,0,0,.42);  
}  
button.danger {  
    background: salmon;  
    color: rebeccapurple;  
}
```

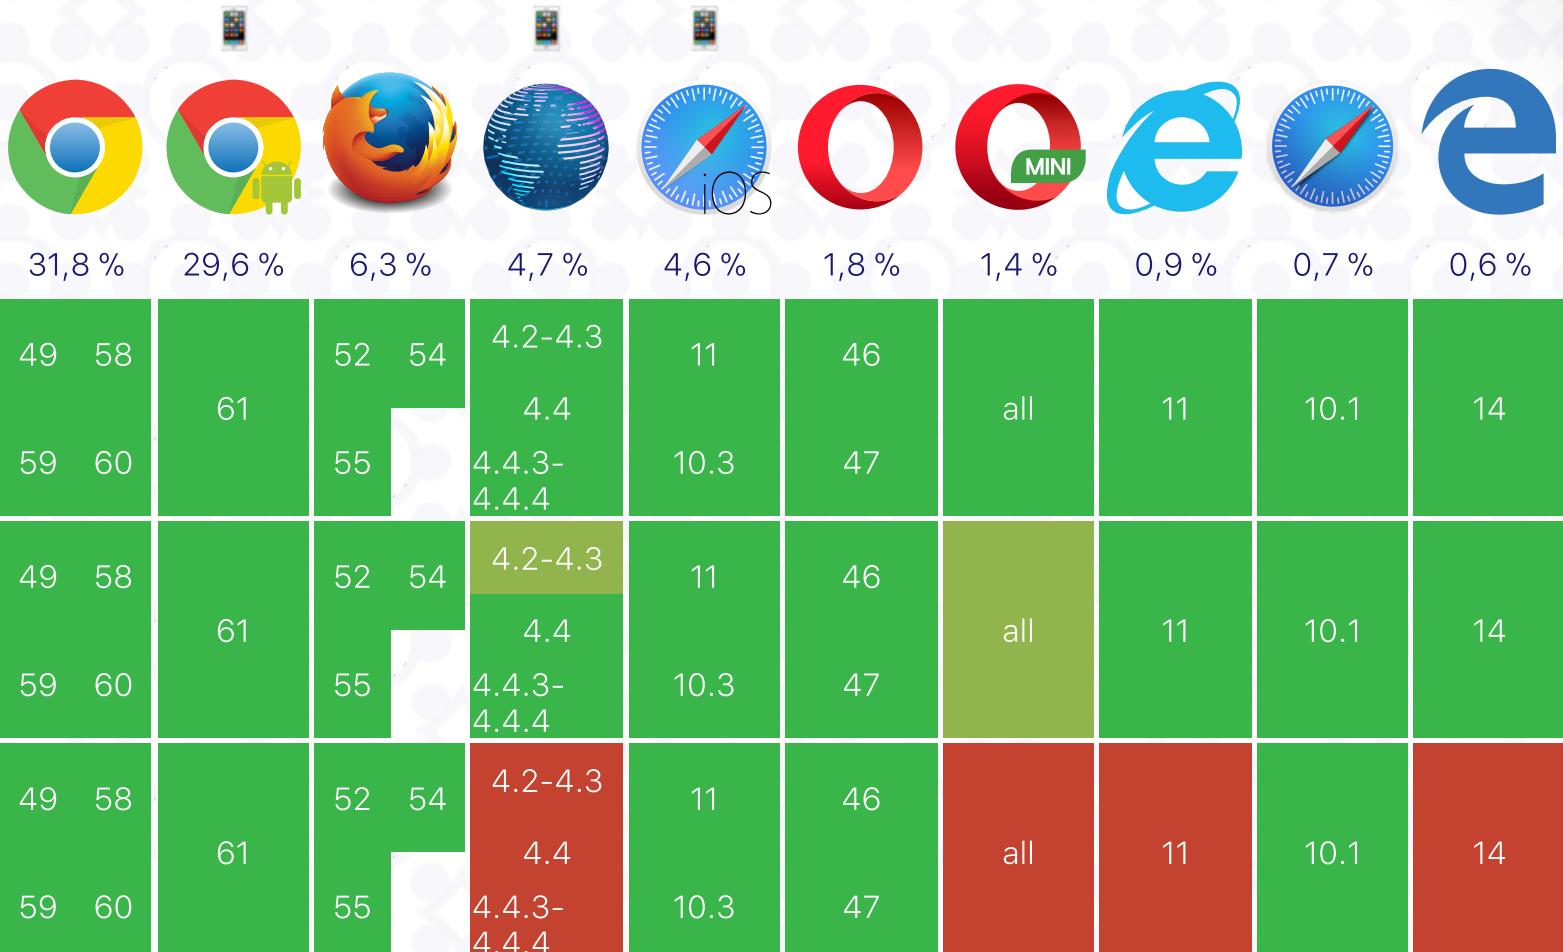

Oui, mais privilégiez:

- le CSS
- les post-processeurs
-  `currentColor`
-  `background-origin`
-  `w3c` CSS Variables (aka Custom Properties)
-  `w3c` CSS Color Module Level 4

    content: '💖💖💖';  
}  
  
fieldset input[type=checkbox] { opacity: 0; }
```

“

The science of operations, as derived from mathematics more especially, is a science of itself, and has its own abstract truth and value.

— Ada Lovelace

# Switch

#34

```
.switch + label {  
    display: block;  
    position: relative;  
    padding: .1em;  
    width: 2em;  
    height: 1em;  
    background-color: #ccc;  
    border-radius: 1em;  
    border: medium solid #444;  
    transition: 0.4s;  
}  
  
.switch:checked + label {  
    background-color: green;  
}
```

```
.switch + label::before {  
    display: block;  
    position: absolute;  
    content: '';  
    top: 0.1em;  
    left: 0.1em;  
    height: 1em;  
    width: 1em;  
    background-color: #fff;  
    border-radius: 50%;  
    transition: all 0.25s;  
}  
  
.switch:checked + label::before {  
    transform: translateX(1em);  
}
```

Switch

## ➡ Hiding Content for Accessibility

```
.panel input[type=checkbox] {  
  position: fixed;  
  left: -100vmax;  
}
```

A screenshot of a user interface element, likely a modal or a panel. At the top, there is a dark header bar with a small blue checkmark icon on the left and the text "Apollo 11" next to it. Below the header is a quote in a white text area with a dark border. The quote is attributed to Margaret H. Hamilton and is dated March 1, 1971.

“ The computer (or rather the software in it) was smart enough to recognize that it was being asked to perform more tasks than it should be performing. It then sent out an alarm, which meant to the astronaut, I'm overloaded with more tasks than I should be doing at this time and I'm going to keep only the more important tasks; i.e., the ones needed for landing ... Actually, the computer was programmed to do more than recognize error conditions. A complete set of recovery programs was incorporated into the software. The software's action, in this case, was to eliminate lower priority tasks and re-establish the more important ones ... If the computer hadn't recognized this problem and taken recovery action, I doubt if Apollo 11 would have been the successful moon landing it was.[26]

*Letter from Margaret H. Hamilton, Director of Apollo Flight Computer Programming MIT Draper Laboratory,  
Cambridge, Massachusetts[27], titled "Computer Got Loaded", published in Datamation, March 1, 1971*

# Principe pour les onglets

# CONCLUSION

1. Utilisez du CSS pour simplifier le code
2. Utilisez intelligemment les pre/post-processeurs
3. HTML, SVG are Awesome !
4. JavaScript, TypeScript can be Awesome !

👉 Traitez le CSS comme du code

1. Revue de code
2. DRY
3. Clean Code
4. Single Responsibility Principle
5. ...
