4

Explorons le ByteCode

5

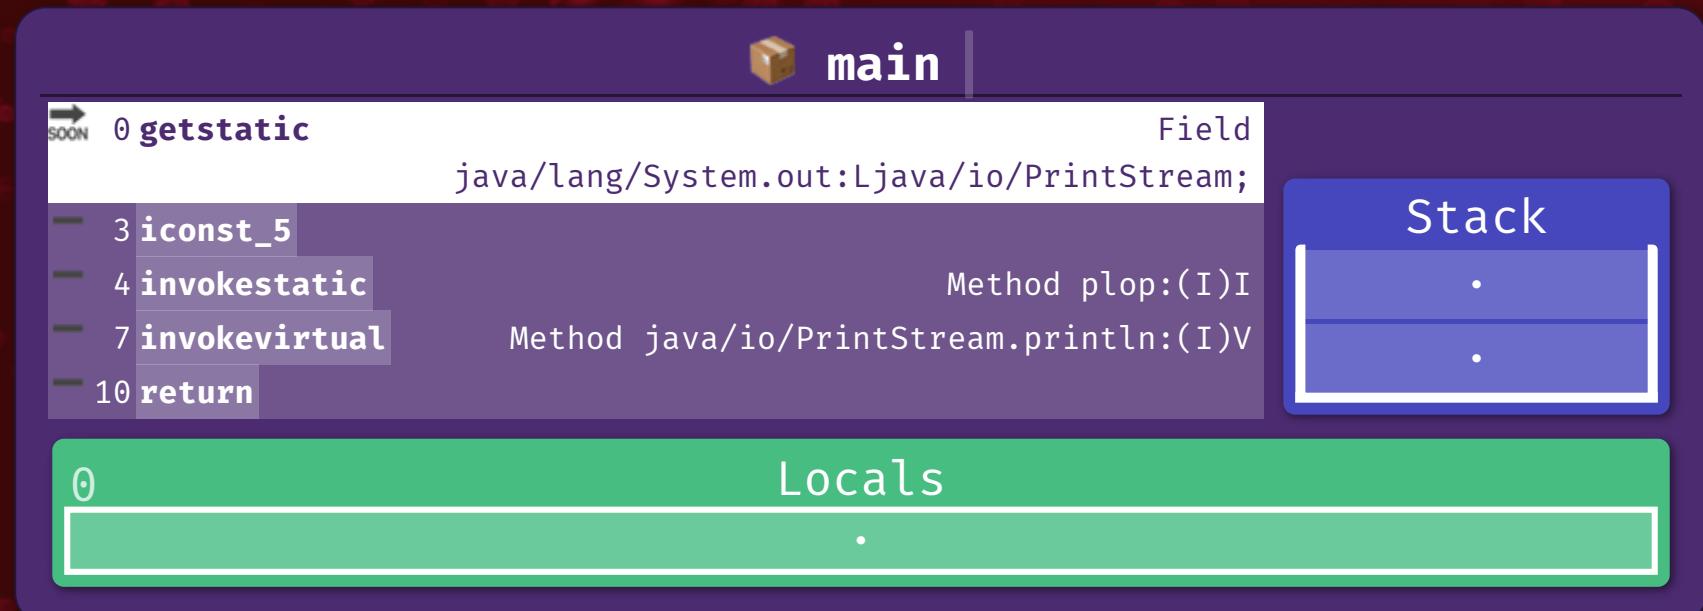

À propos du ByteCode

- environ 200 opérations possibles (maxi. 256 opcodes)
- préfix pour le type d'opérations (`i` pour entier, `d` pour double, ...)
- manipulation de la pile, des variables locales (`iconst_0`, `istore`, `iload`, ...)
- contrôle du flux des instructions (`if_icmpgt`, `goto`, ...)
- manipulation d'objets (`invokevirtual`, `invokedynamic`, ...)
- arithmétiques et conversion de type (`iadd`, `iinc`, `i2d`, ...)
- autres (`athrow`, ...)

            6: lstore_1
            7: aconst_null
            8: checkcast   #10         // class java/lang/
            11: astore_3
            12: return
}
```

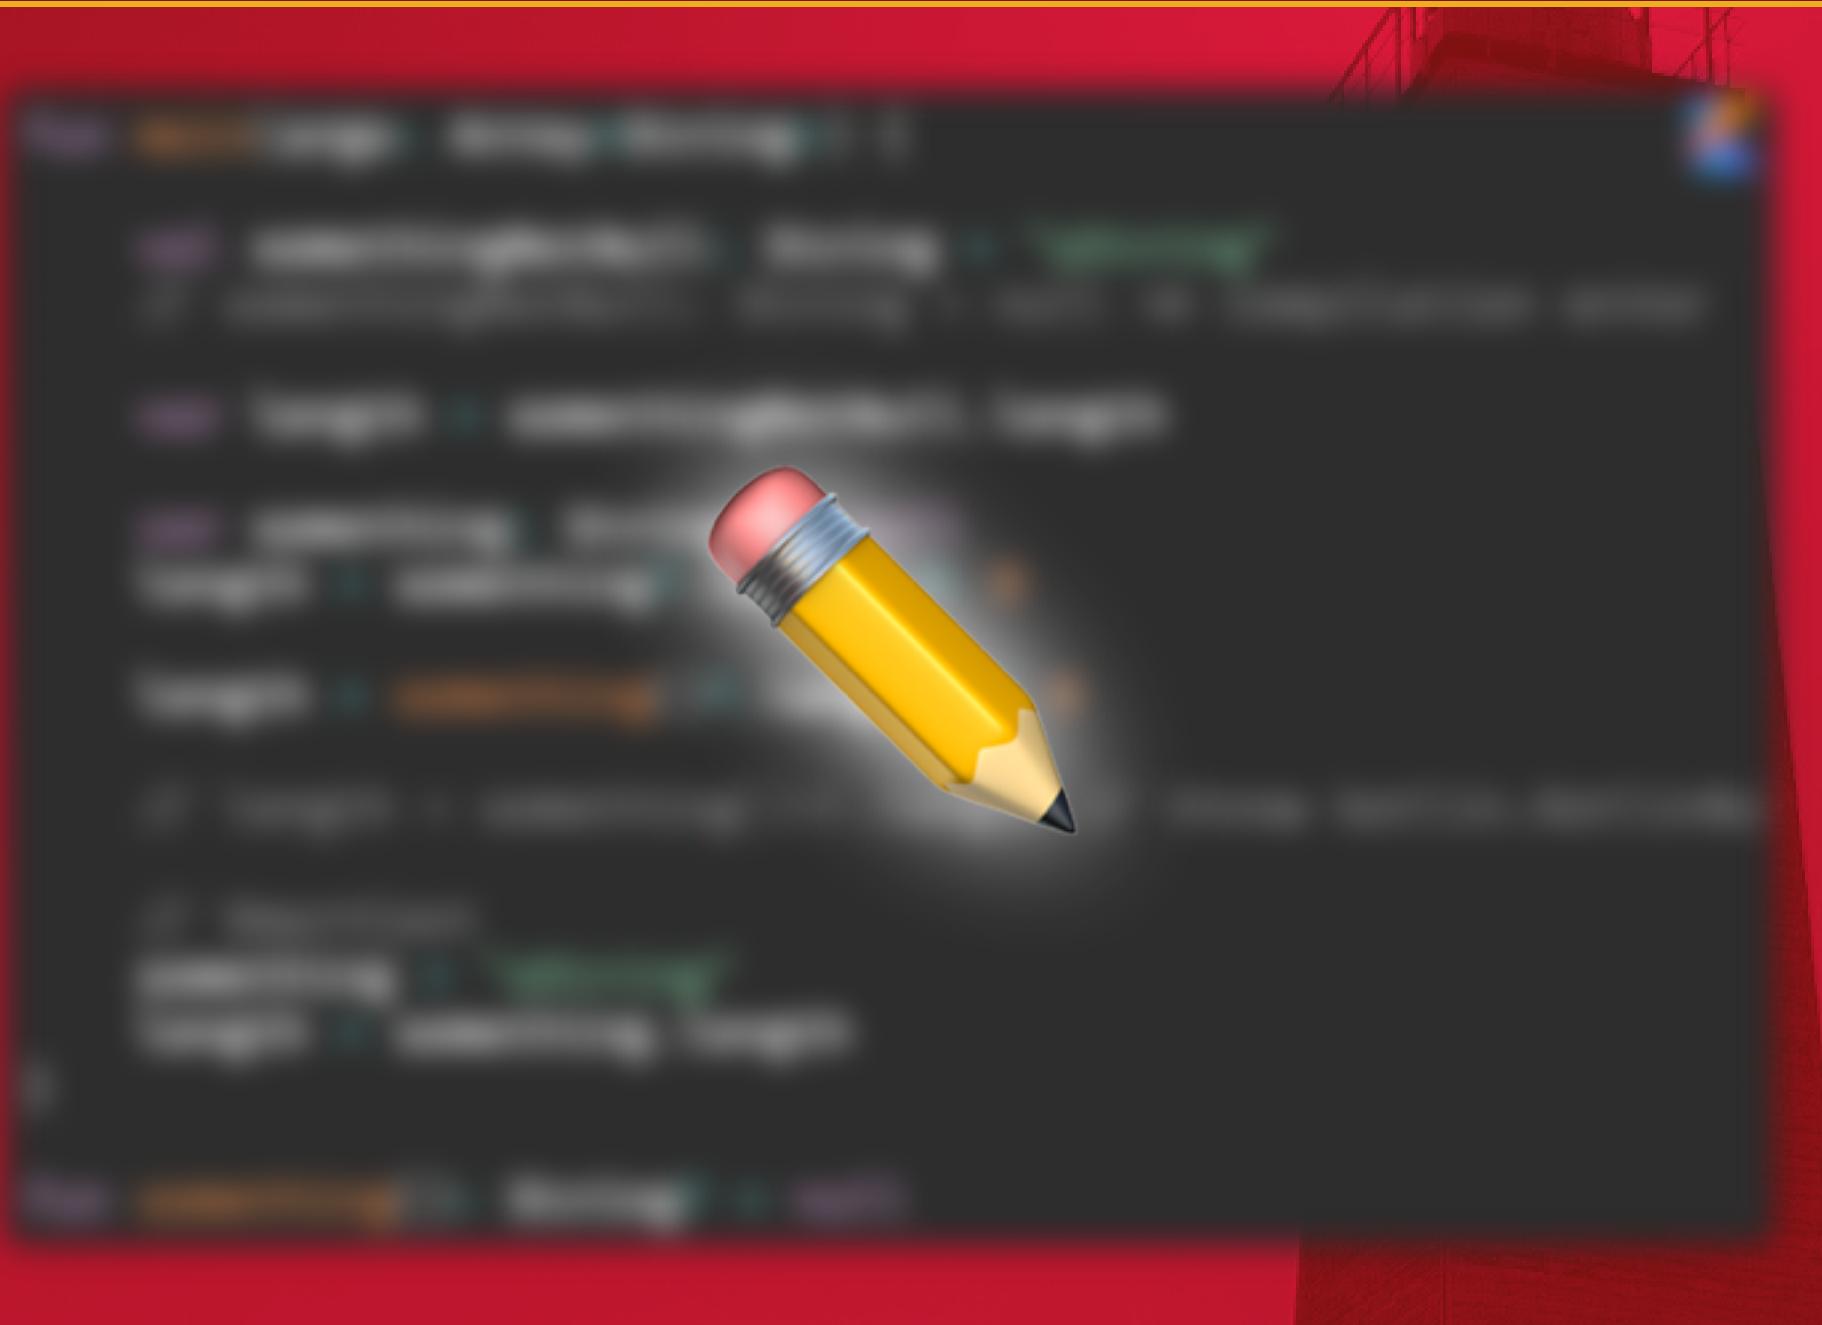

- plus de ; *
- 😍 String templating
- 😊 plus de types primitifs (avant la compilation)
- 🤔 inférence de types
- on peut mélanger du code Java et Kotlin

null-safety

“ I call it my billion-dollar mistake. It was the invention of the `null` reference in 1965. At that time, I was designing the first comprehensive type system for references in an object oriented language (ALGOL W). My goal was to ensure that all use of references should be absolutely safe, with checking performed automatically by the compiler. But I couldn't resist the temptation to put in a `null` reference, simply because it was so easy to implement. This has led to innumerable errors, vulnerabilities, and system crashes, which have probably caused a billion dollars of pain and damage in the last forty years.

--Tony Hoare (C.A.R. Hoare)

➡ Null References: The Billion Dollar Mistake

null-safety.java

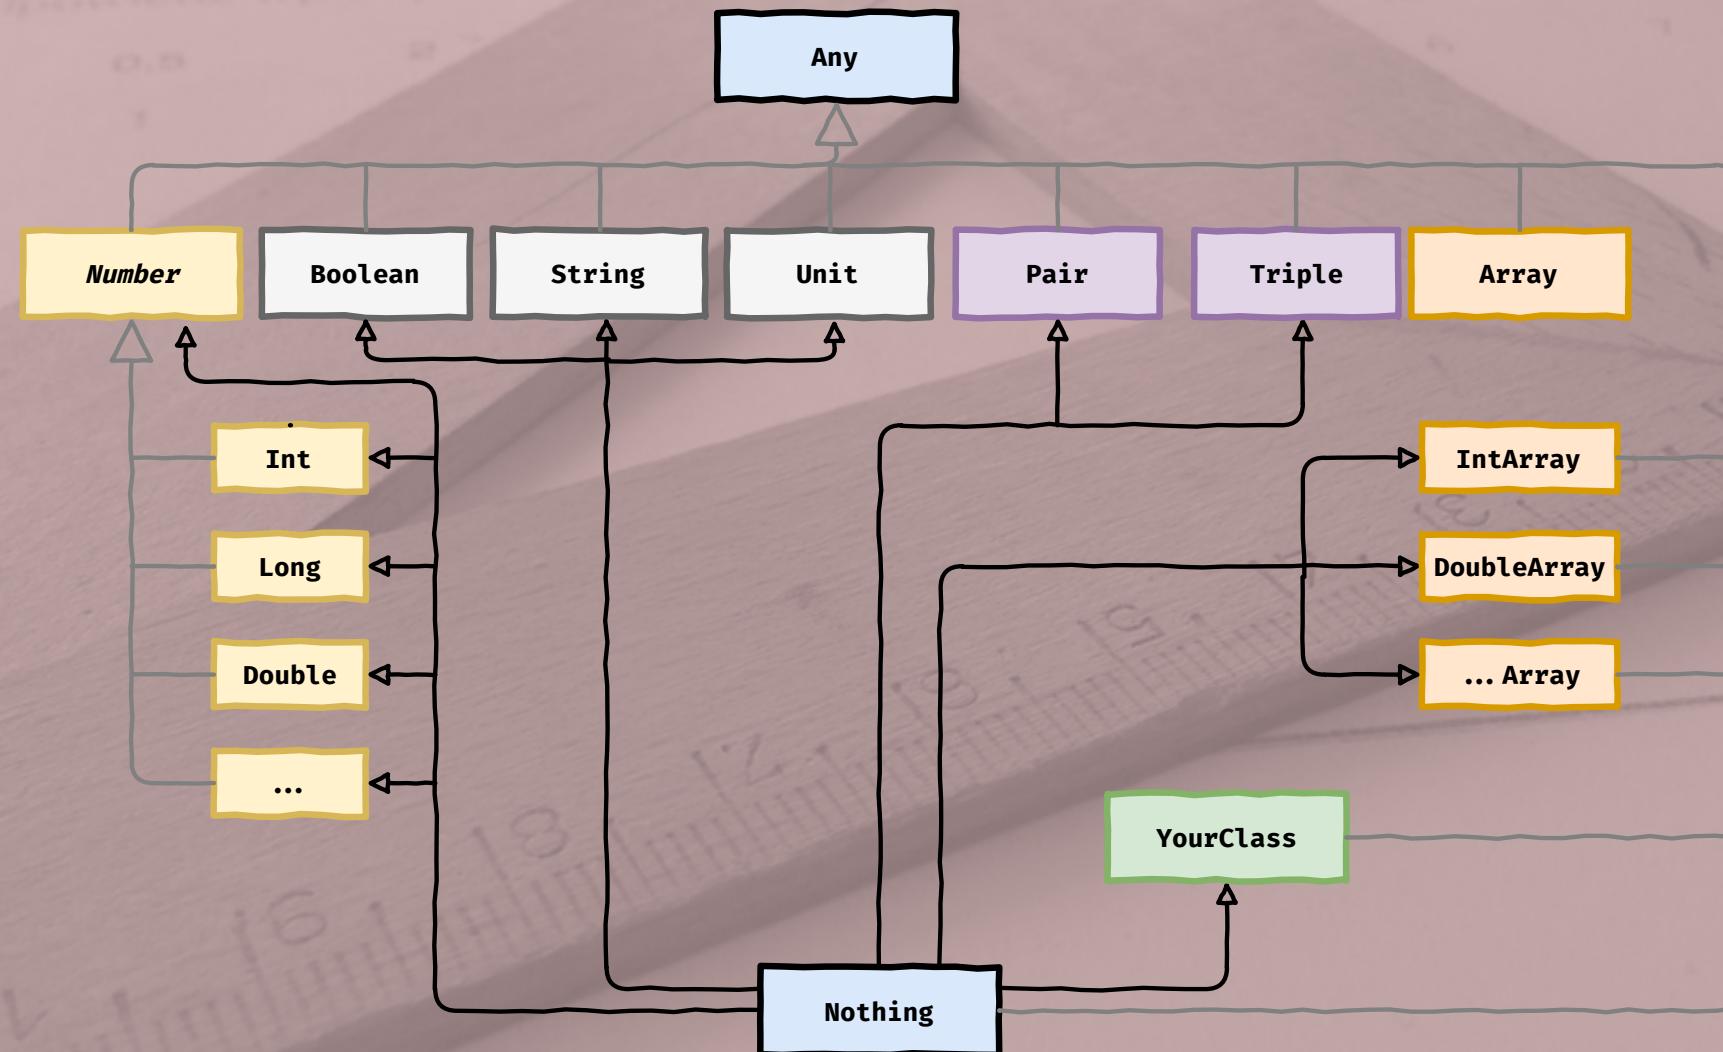

- plus de `NullPointerException`
- ⚠ quand on appelle du Java

       42: invokevirtual #29         // Method java/lang/StringBuilder.toString()Ljava/lang/String;
       45: areturn
    }
}
```

✨ Conseils

- Toujours typer le retour de vos fonctions (sauf si c'est évident et une surcharge comme le `toString`)
- Kotlin est plus expressif que Java => évitez de faire des fonctions trop longues
- Sautez une ligne après le `=`
- Utilisez le passage des arguments par nom quand ça lève des ambiguïtés

Notes

- Le passage des arguments par nom, ne marche pas sur les appels de code Java

Les lambdas

function.kt

```
// Declare apply function with function as parameter
fun apply(x: Int, y: Int, operation: (Int, Int) → Int): Int =
    operation(x, y)

// Declare function
fun sumf(x: Int, y: Int) =
    x + y

// call apply with function reference
val sum5 = apply(2,3, ::sumf)

// store function reference
val sumLam = ::sumf

// call apply with the function reference
val sum6 = apply(1,5, sumLam)
```

function.java

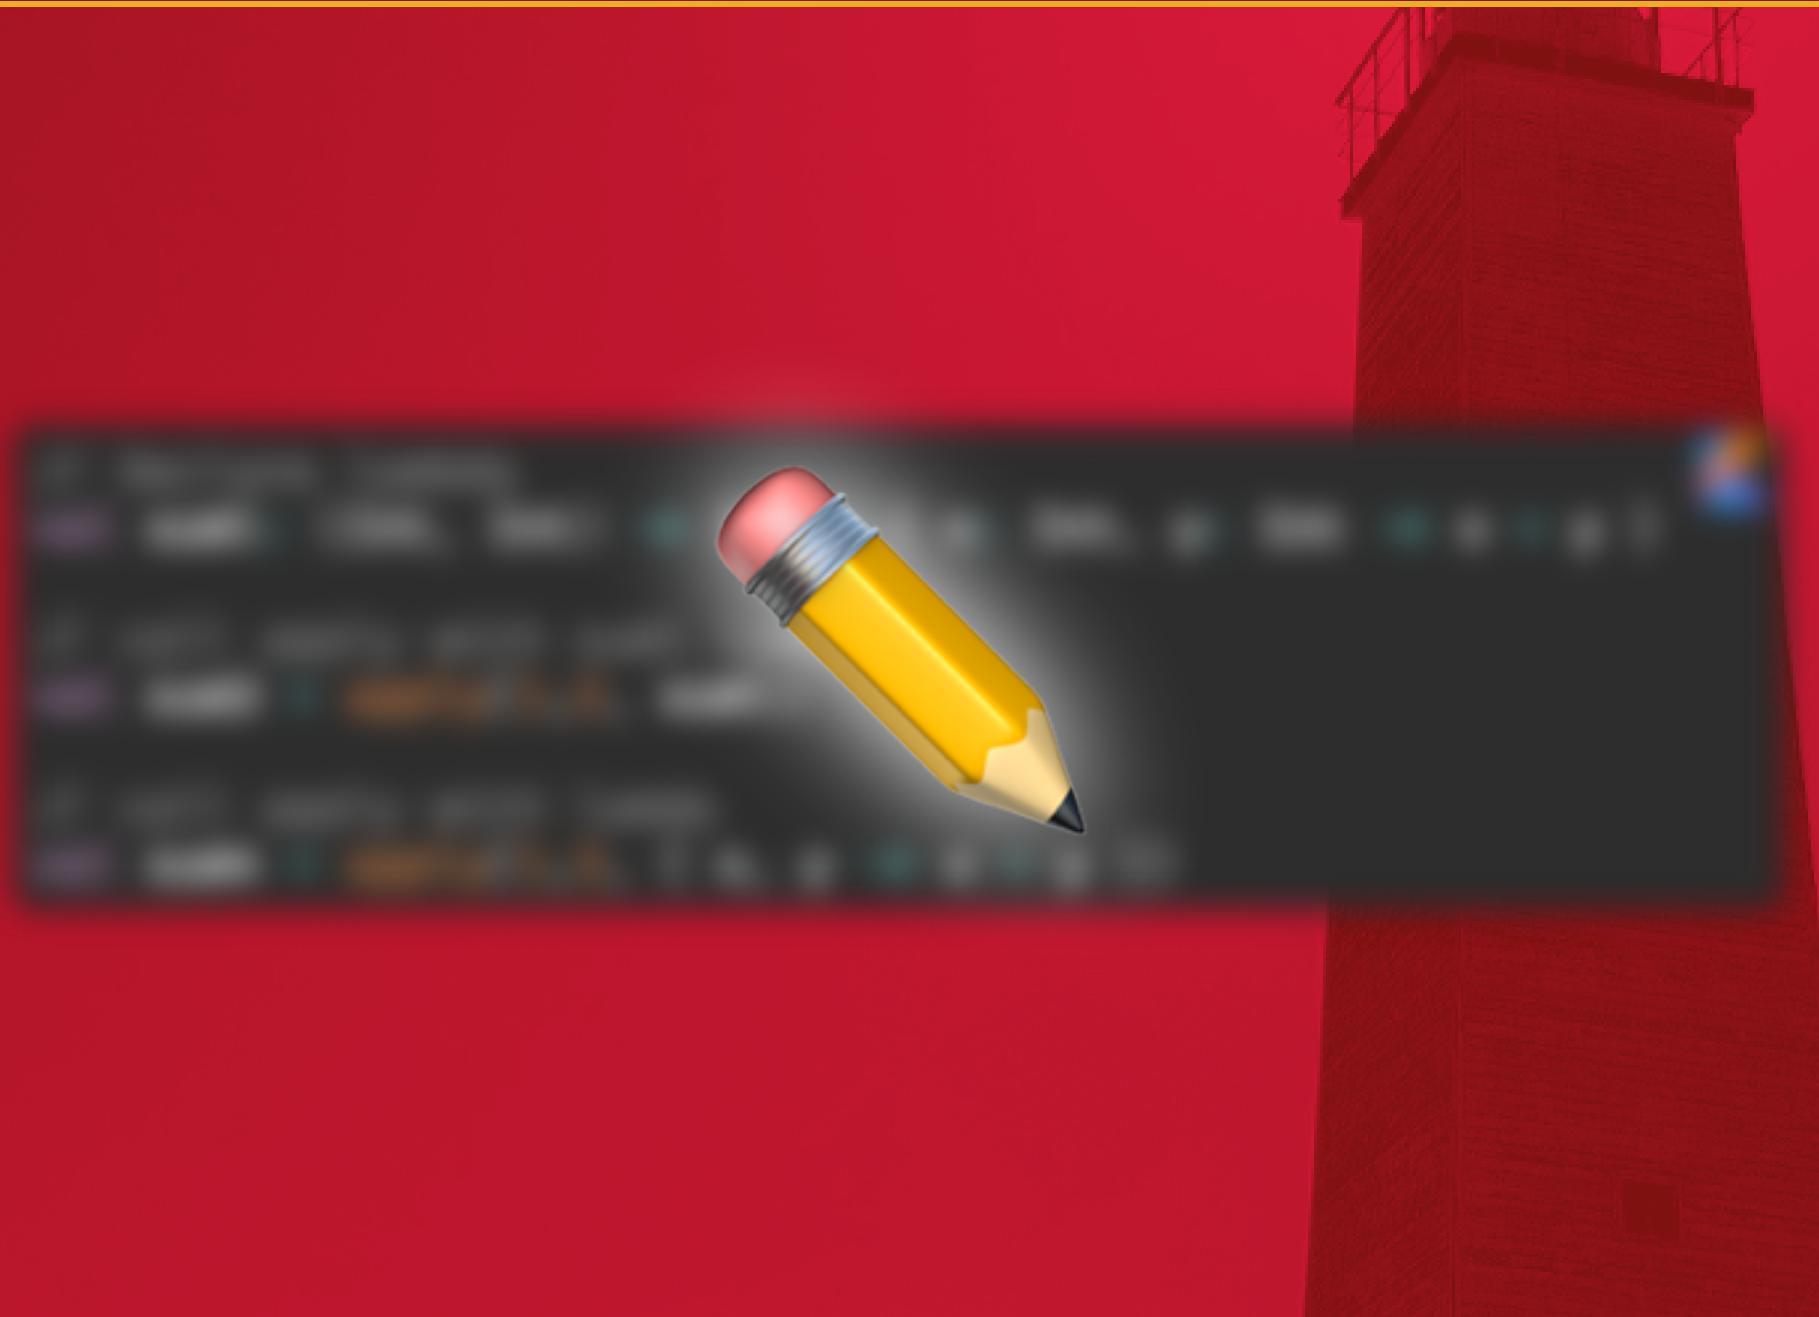

```
package _04_lamda;

import kotlin.Metadata;
import kotlin.jvm.functions.Function2;
import kotlin.jvm.internal.Intrinsics;
import kotlin.reflect.KFunction;

```
package _04_lamda;

import kotlin.Metadata;
import kotlin.jvm.functions.Function2;
import org.jetbrains.annotations.NotNull;

@Metadata(
    mv = {1, 1, 9},
    bv = {1, 0, 2},
    k = 2,
    d1 = {"\u0000\u0012\n\u0000\n\u0002\u0010\b\n\u0002\b\u0001",
    d2 = {"sum3", "", "getSum3", "()I", "sum4", "getSum4", "su
)
public final class LambdaKt {
    @NotNull
    private static final Function2 suml;
    private static final int sum3;
    private static final int sum4;

    @NotNull
    public static final Function2 getSuml() {
```

```
val other = sumf(1,2)
    .let { it + 1 }

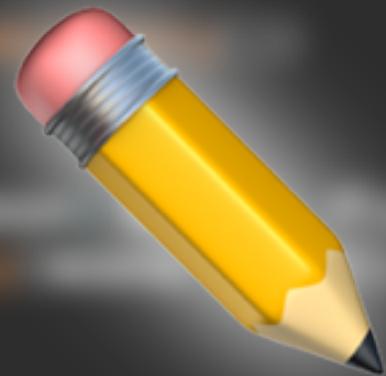

val nullable = maybeAnInt()
    ?.let { it + 1 }
```

- ! pas de `return`
- pensez à mettre vos lambda comme dernier argument
- voir aussi les `apply`, `also`, `run`, `use`, `with`

Les classes

astronomy.java

5b

Héritage en Kotlin

#57

- ! Les contrôles de types génériques ne sont fait qu'au moment de la compilation
- Covariant (consome): `out`, en java ? `extends T`
- Contravariant (produit): `in`, en java ? `super T`

Borne supérieur

```
fun <T : Comparable<T>> sort(list: List<T>): List<T>
```

Les détails: 

<https://kotlinlang.org/docs/reference/generics.html>

```
interface Function<in T, out U>
```

```
Function<*, String> // correspond à Function<in Nothing, String>
```

```
Function<Int, *> // correspond à Function<Int, out Any?>
```

```
Function<*, *> // correspond à Function<in Nothing, out Any?>
```

```
sealed class JsonValue

data class JsonObject(val attributes: Map<String, JsonValue>)
data class JSONArray(val values: List<JsonValue>) : JsonValue()
data class JsonString(val value: String) : JsonValue()
data class JsonNumber(val value: Number) : JsonValue()
data class JsonBoolean(val value: Boolean) : JsonValue()
object JsonNull : JsonValue()
```

Alias en Kotlin

#61

```
interface Entity

typealias Id = String
typealias Version = Int
typealias EntityKey = Pair<Id, Version>

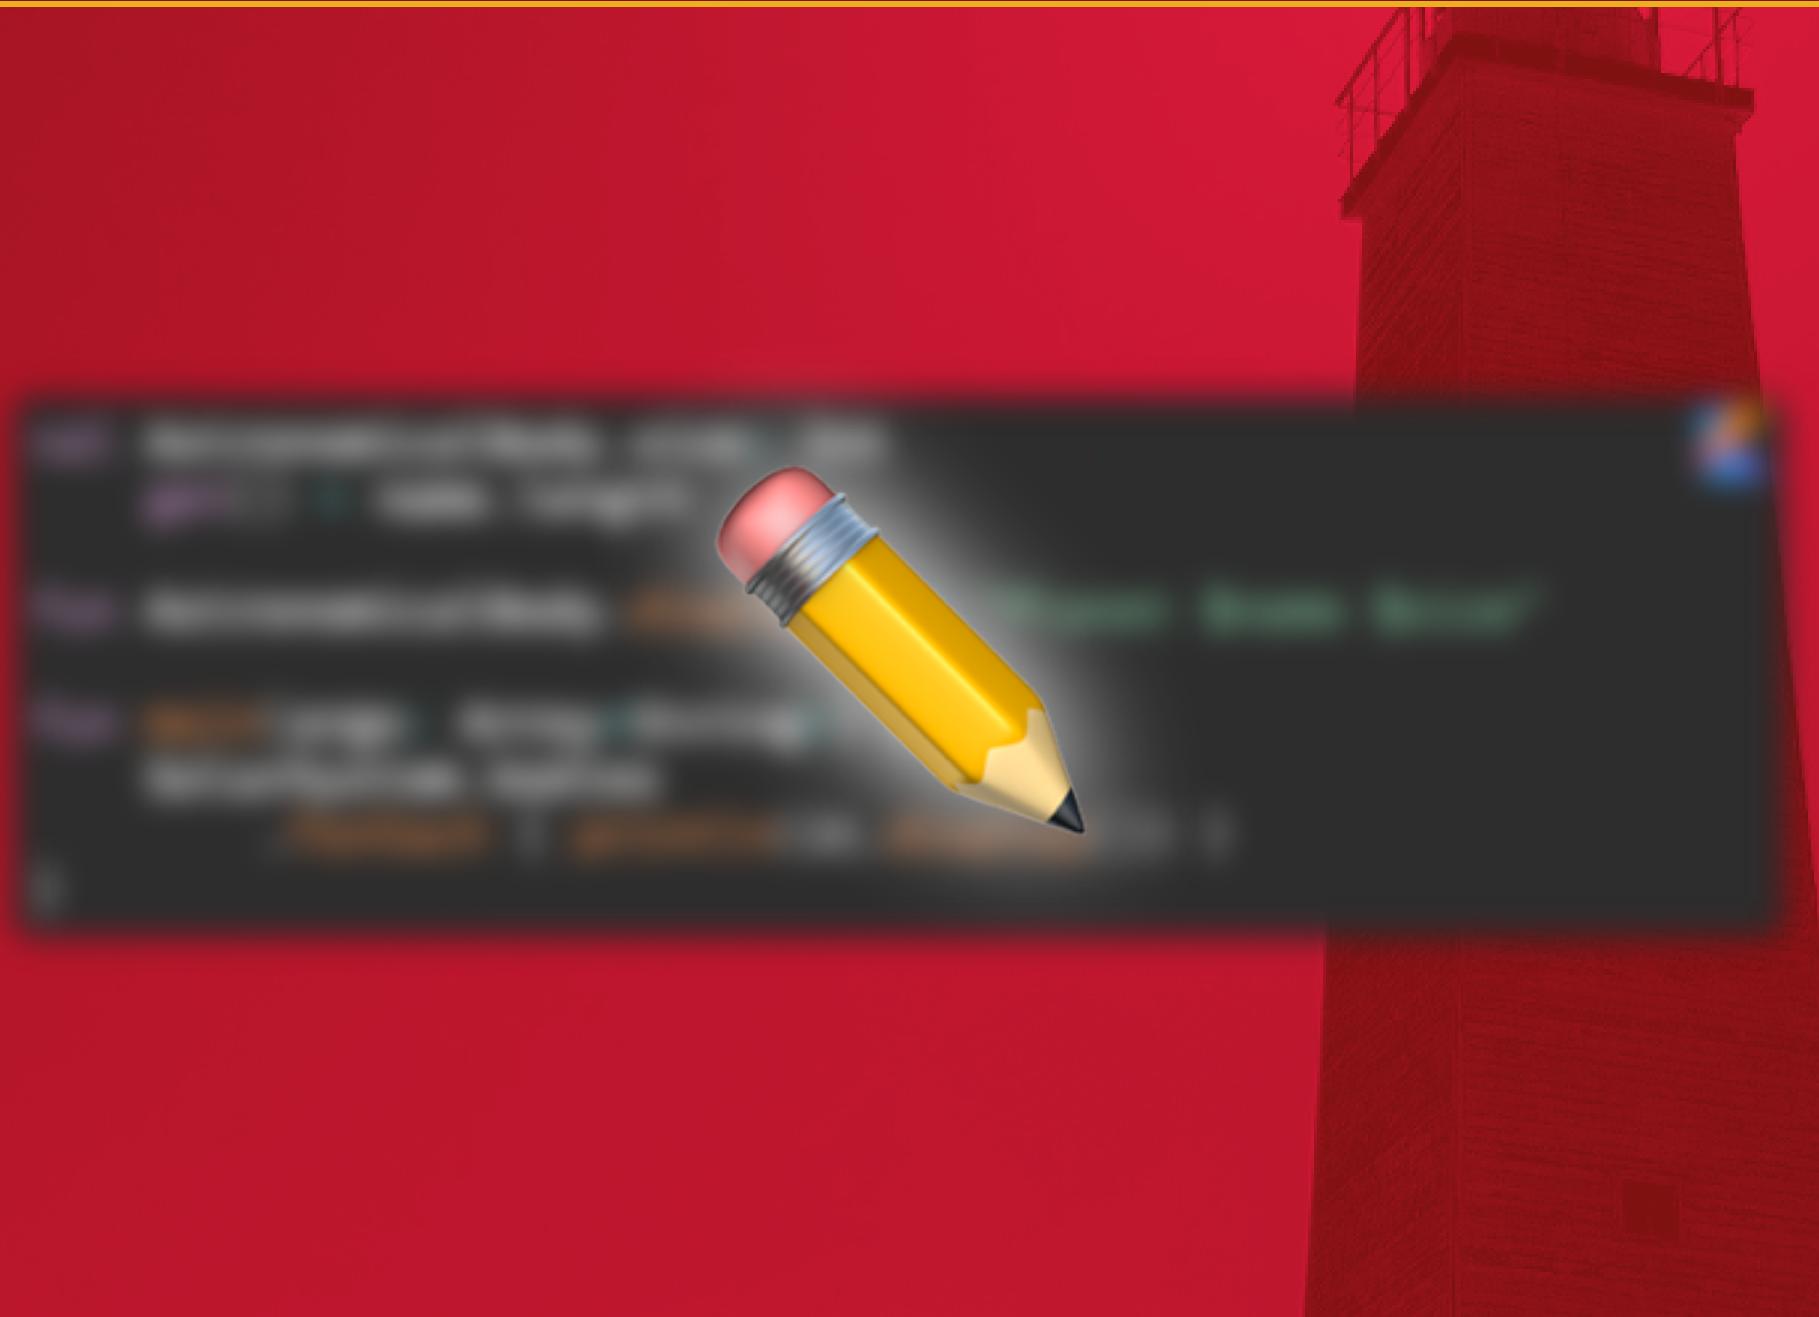

// fun getAllEntities(): Map<Pair<String, Int>, List<Entity>>
fun getAllEntities(): Map<EntityKey, List<Entity>> = emptyMap()
```

```
Compiled from "typealias.kt"
public final class _06_class_2.TypealiasKt {
    public static final java.util.Map<kotlin.Pair<java.lang.String, kotlin.Unit>> mapOf() {
        Code:
            0: invokestatic #12                      // Method kotlin/collection/MapKt.mapOf()
            3: areturn
    }
}
```

- 😂 **data class**
- 🤔 Mais pourquoi on n'a pas ça en Java ?
- Une seule classe par fichier n'est pas utile
- 😎 **sealed** permet de faire des types algébriques de données (Algebraic Data Type)

Extensions de fonctions

extension.java

```
package _08_extension;

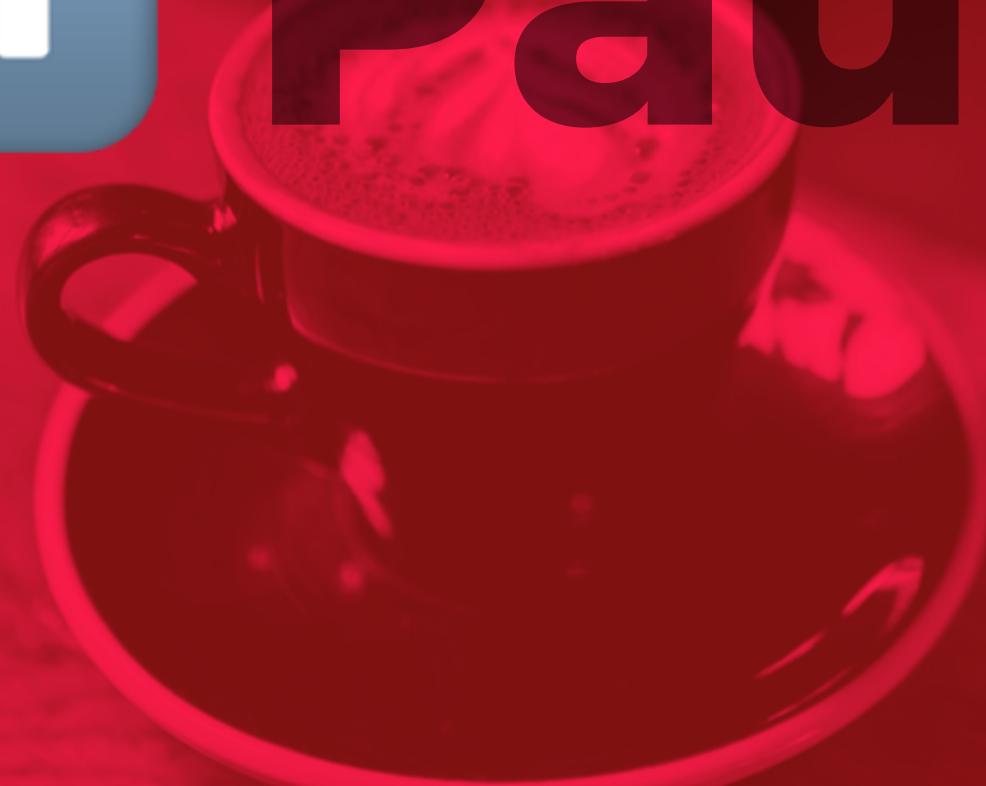

import astronomy.AstronomicalBody;
import astronomy.SolarSystem;
import java.util.Iterator;
import kotlin.Metadata;
import kotlin.jvm.internal.Intrinsics;
import org.jetbrains.annotations.NotNull;

@Metadata(
    mv = {1, 1, 9},
    bv = {1, 0, 2},
    k = 2,
    d1 = {"\u0000 \n\u0000\n\u0002\u0010\b\n\u0002\u0018\u0002"},
    d2 = {"size", "", "Lastronomy/AstronomicalBody;", "getSize"}
)
public final class ExtensionKt {
    public static final int getSize(@NotNull AstronomicalBody $receiver) {
        Intrinsics.checkNotNullParameter($receiver, "$receiver");
        return $receiver.getName().length();
    }
}

Performances sur 10 !

#88

 Ne croyez pas les benchmarks, faites les vous-même !

<https://github.com/MonkeyPatchlo/kotlin-perf>

Benchmark	Mode	Cnt	Score	Error	Units
factorialJava	thrpt	200	274141213.561	± 28963758.069	ops/s
factorialKotlinFor	thrpt	200	267717955.205	± 8457315.205	ops/s
factorialKotlinRec	thrpt	200	56270660.700	± 2453418.383	ops/s
factorialKotlinTailRec	thrpt	200	341898899.761	± 11456349.191	ops/s

Bilan structures

- Il y a aussi des `break` et `continue`, label pour les boucles
- `when` peut être utiliser avec
 - des constantes,
 - plusieurs valeurs séparées par `,`
 - une expression
 - avec `is` et un type (avec un 'smart cast')

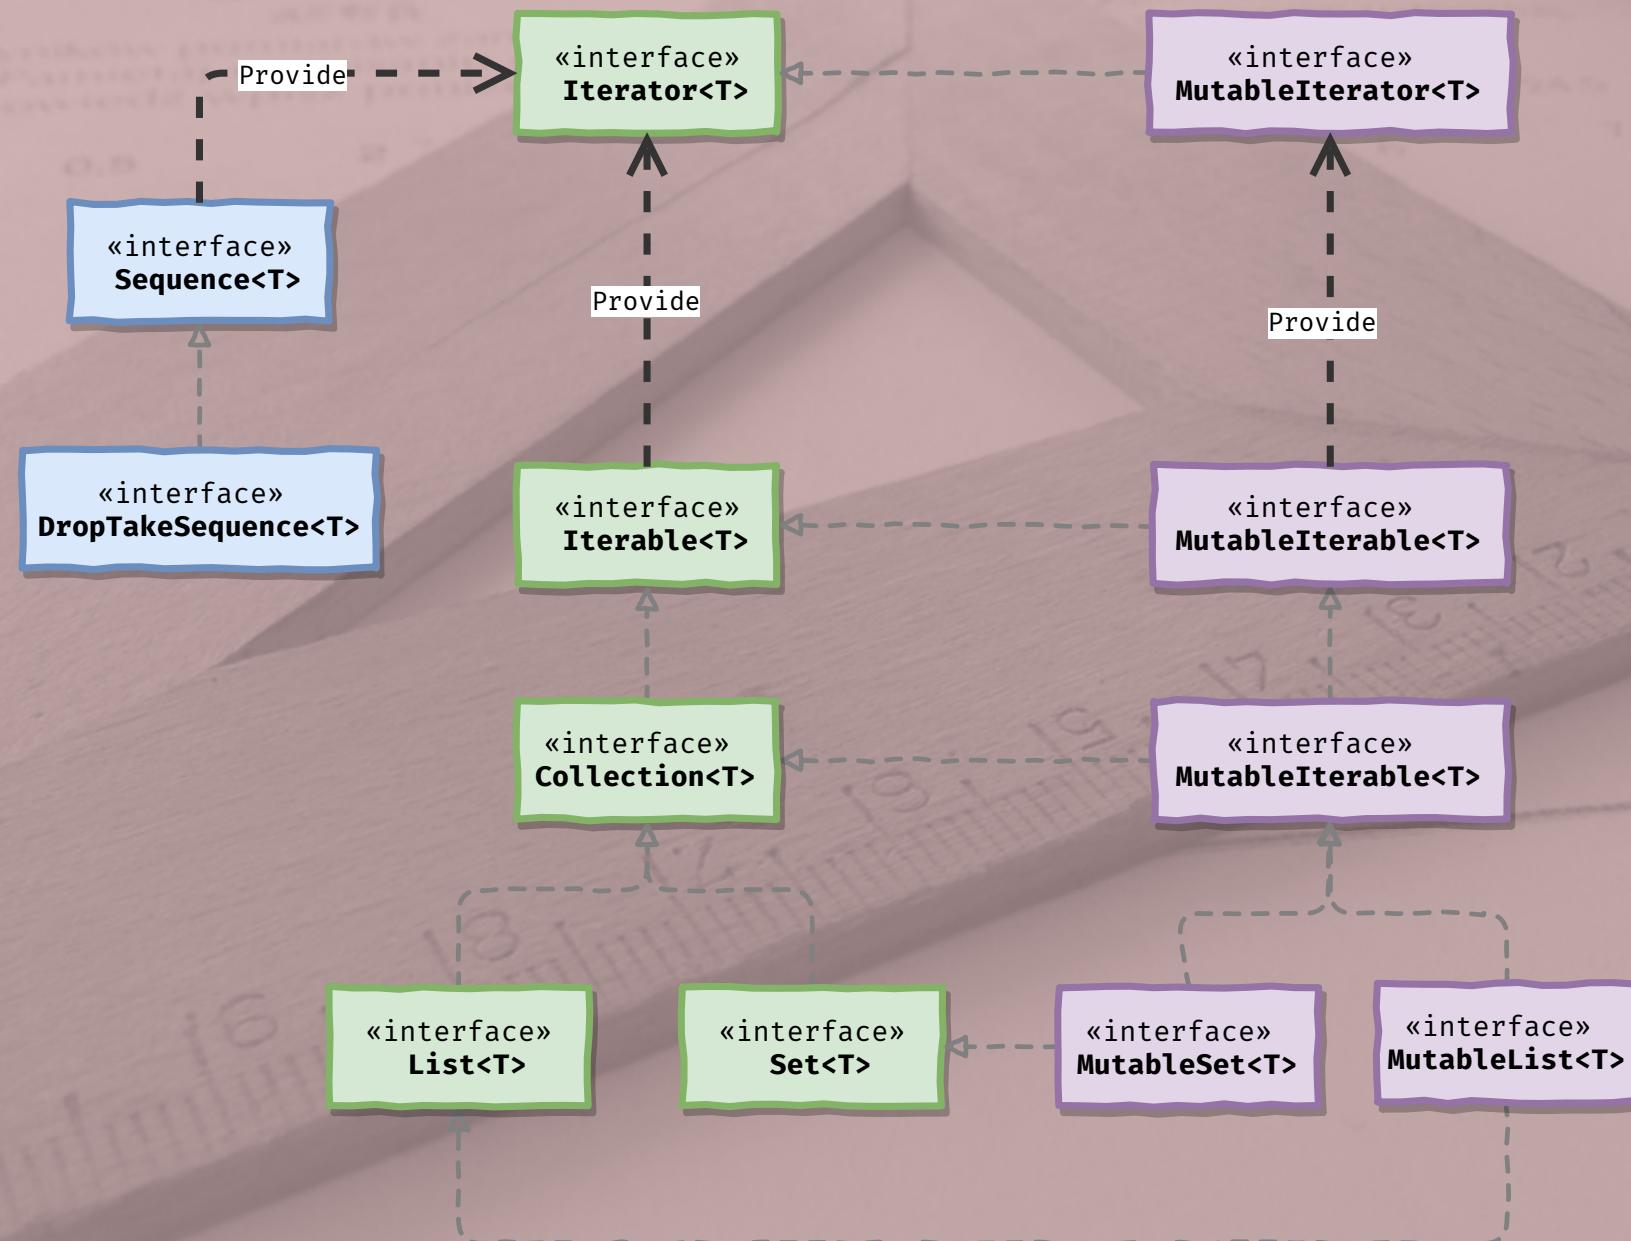

💡 Tips

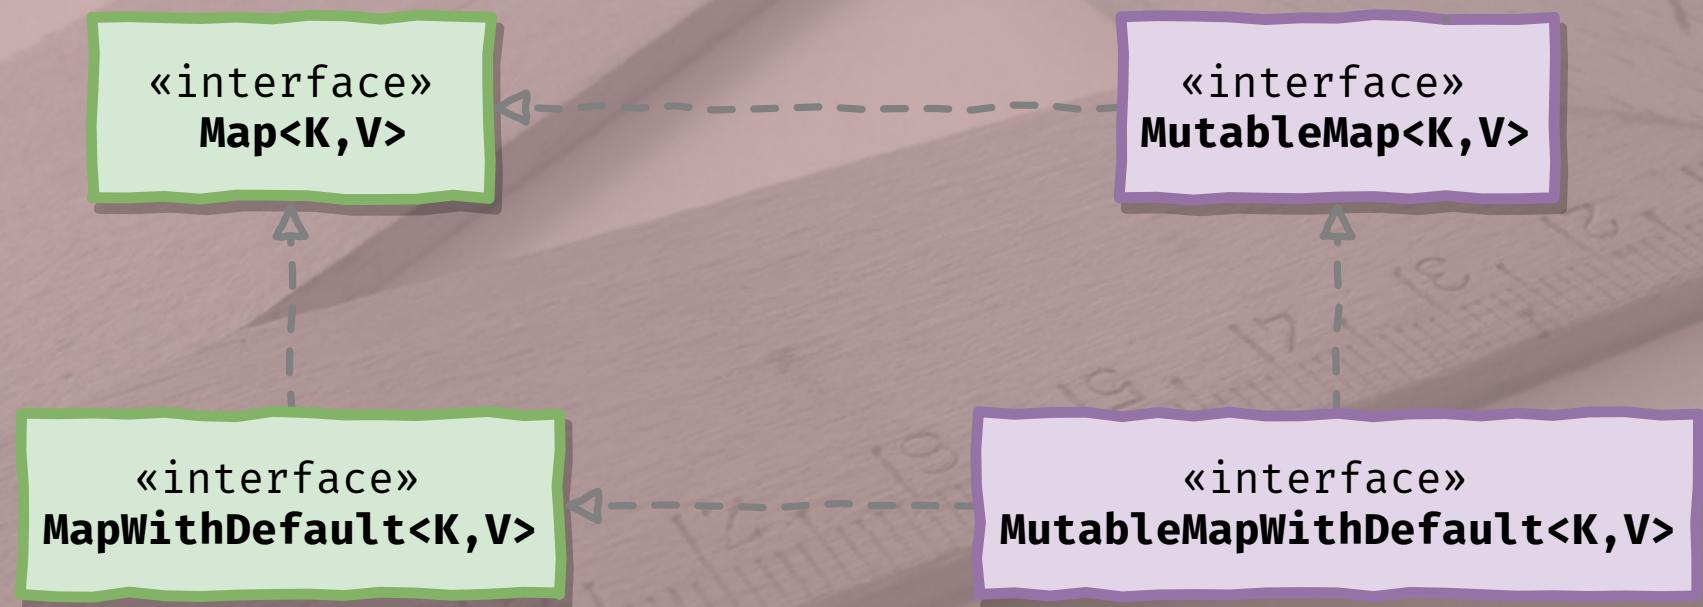

- privilégier les `when` si vous avez plus de 2 cas
- si vous faites des fonctions récursives, faites les `tailrec`

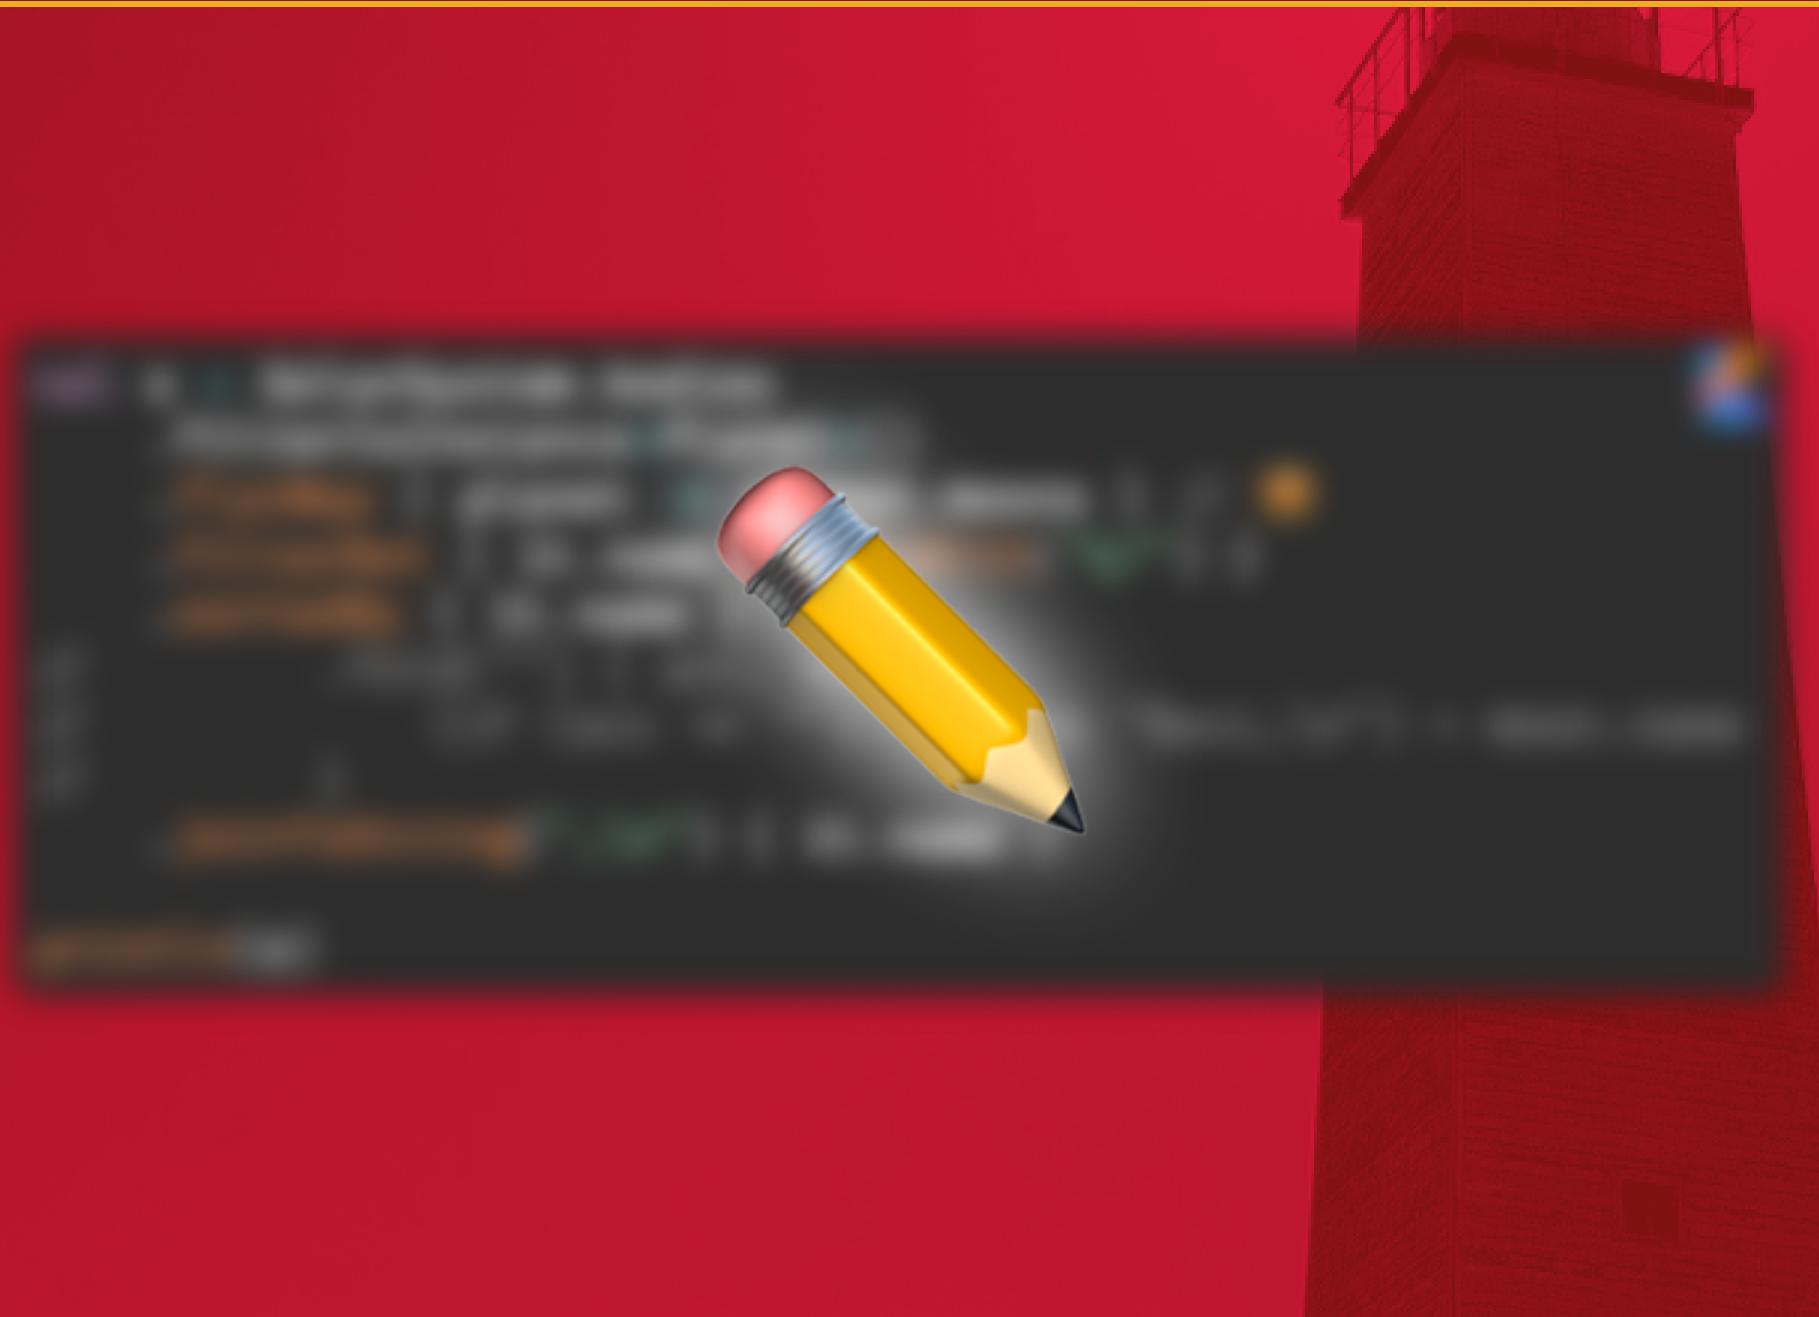

Les collections

Collections

#91

immutable-mutable.kt

#94

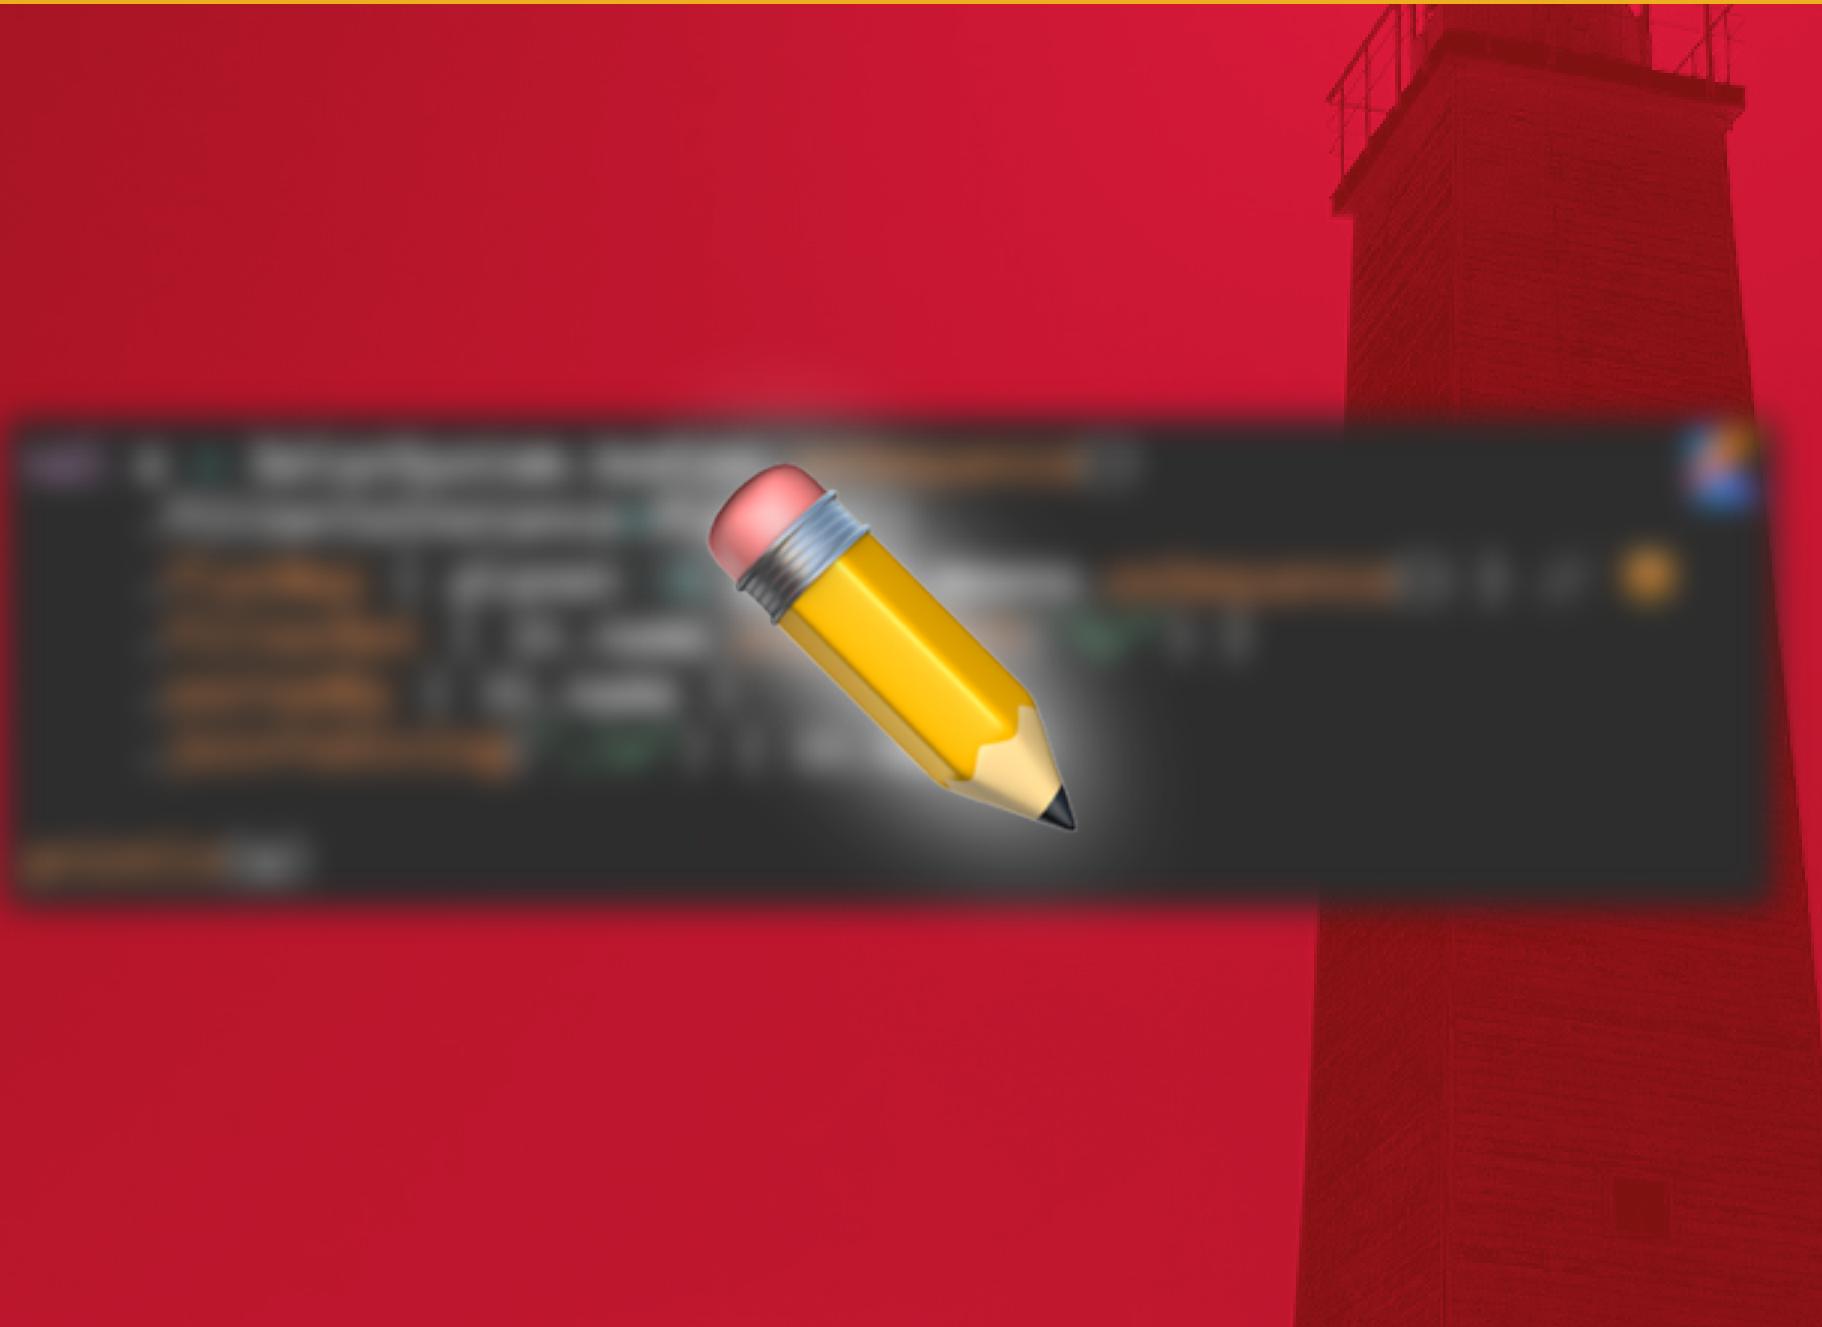

break-immutable.kt

#95

sequence.kt

#96

Performance des sequences 1/2

#97

 Ne croyez pas les benchmarks, faites les vous-même !

Benchmark	Mode	Cnt	Score	Error	Units
collectionApiClassic	thrpt	200	44535.029	± 3550.944	ops/s
collectionApiSequence	thrpt	200	23652.238	± 1967.535	ops/s

sequence2.kt

```
val s = SolarSystem.bodies.asSequence()  
    .filterIsInstance<Planet>()  
    .flatMap { planet → planet.moons.asSequence() } // 😎  
    .filterNot { it.name.startsWith("S/") }  
    .map { it.name }  
    .first()  
  
println(s)
```

Performance des sequences 2/2

#99

 Ne croyez pas les benchmarks, faites les vous-même !

Benchmark	Mode	Cnt	Score	Error	Units
collectionApiClassicFirst	thrpt	200	241752.062	± 5022.663	ops/s
collectionApiSequenceFirst	thrpt	200	3615451.391	± 454502.198	ops/s

timed-sequence.kt

#100

```
for (i in 1..3) print(i) // prints 123  
  
for (i in 3 downTo 1) print(i) // prints 321  
  
for (i in 1..5 step 2) print(i) // prints 135
```

ranges.java

#102

```
fun main(args: Array<String>) {  
    val aPair = Pair("Earth", "Moon")  
    val (planet, moon) = aPair  
  
    val aTriple = Triple("Voyager 1", 1977, listOf("Jupiter",  
    val (probeName, launchYear, flyOver) = aTriple  
}
```

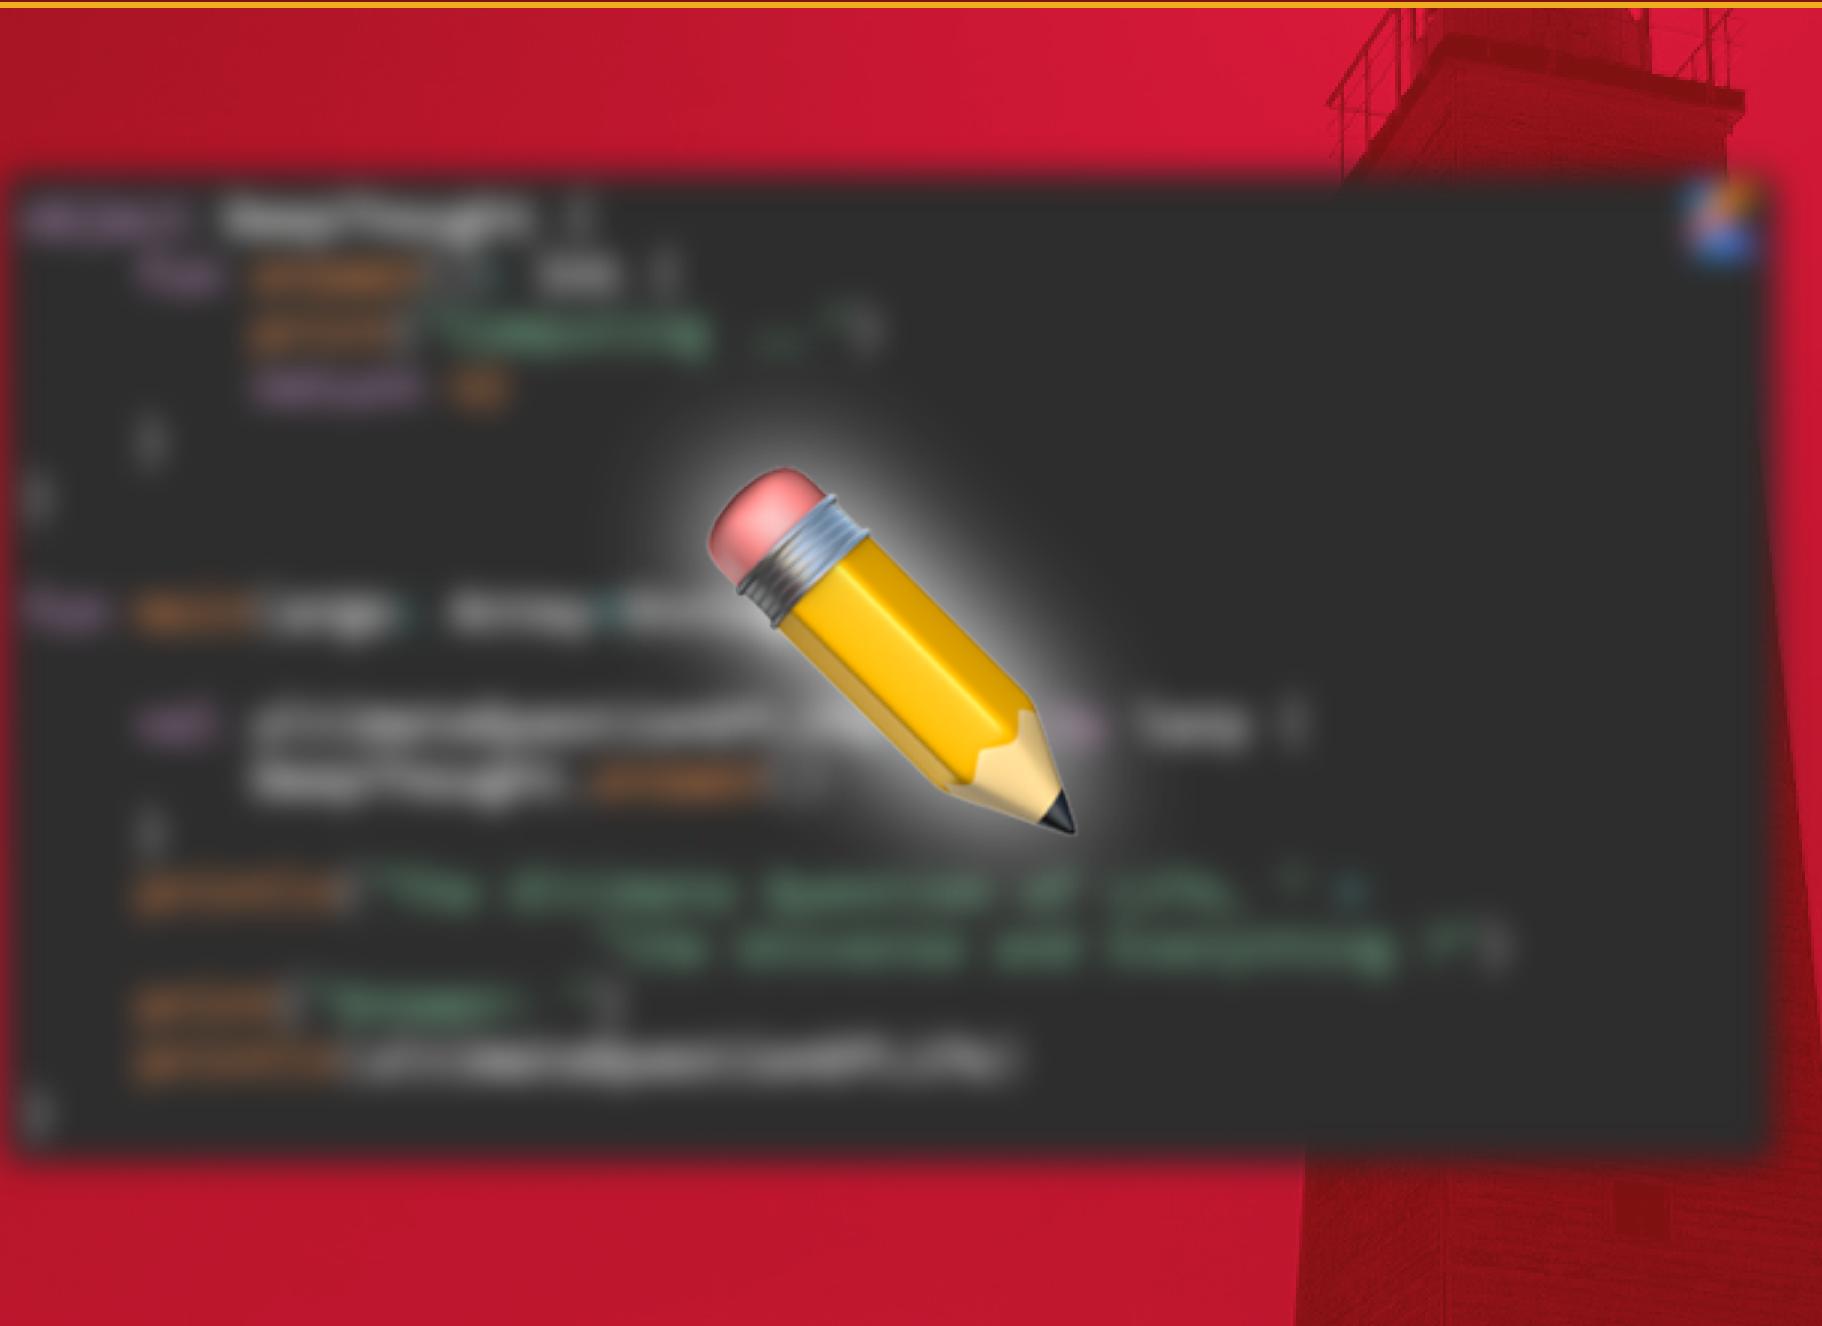

- Super on a de l'immutabilité, des `map`, `flatMap`, `fold`, `aggregate`...
- Mais ça reste des collections Java
- Avant d'utiliser les sequences, faites des mesures

Les delegates

```
lateinit var str: String\n\nfun main(args: Array<String>) {\n    // println(str) kotlin.UninitializedPropertyAccessException\n    str = "Hello Devoxx"\n    println(str)\n}
```

- lateinit : évite les null check pour les propriétés qui ne peuvent être initialisées immédiatement (ex référence de vues sur **Activity**, **Fragment**).
 - Ne peut pas être utilisé avec les types primitifs
- Lazy : utile pour les propriétés qui ne sont pas systématiquement utilisées.
- **⚠** À manipuler avec précaution dans les activités Android (avec le cycle de vie, cela peut référencer une ancienne instance)
- Delegate : Observable, Not null, ...

Un peu plus sur les fonctions

```
import java.time.Instant

class Logger(private val name: String) {
    private enum class Level { TRACE, DEBUG, INFO, WARN, ERROR }
    private val level = Level.INFO

    fun info(message: () -> String) {
        log(Level.INFO, message)
    }

    private inline fun loglvl: Level, message: () -> String)
        if (level >= lvl) {
            println("[${level.name}] $name - ${message()}")
        }
    }

    fun main(args: Array<String>) {
        val logger = Logger("Main")

        logger.info { "Time: ${Instant.now()}" }
    }
}
```

Logger.java

#114

Cas d'utilisation du `reified`

- pour créer des extensions kotlin des fonctions Java qui utilisent des `Class<T>`

Cas d'utilisation des `inline`, `noinline`

- quand on utilise `reified`
- quand on sait se qu'on fait, 
<https://kotlinlang.org/docs/reference/inline-functions.html>

Conclusion

- Faible surcharge
- Support officiel par Google
-  Using Project Kotlin for Android
-  Kotlin Guide
-  android-ktx
-  Kotlin Android Extensions

- Supporter officiellement depuis  Spring 5,  Spring Boot 2
-  SparkJava,  javalin
-  Vert.x
-  KTor
- ...
